

HEPATITIS C: GET TESTED. IT'S CURABLE.

- Hepatitis C is a liver infection that is usually silent, but over time can cause chronic liver damage (Cirrhosis, Liver Cancer)
- Persons at highest risk for Hepatitis C include Baby Boomers (born between 1945-1965), people who have received a tattoo or piercing in an unregulated facility (jail, home, hotel, etc.), people who have used injection drugs, people who have ever snorted drugs, people who received blood transfusions prior to 1992, and people who received an organ transplant prior to 1992.
- However, 50% of people with Hepatitis C have no identifiable risk factors
- The only way to know your status is to get tested
- If you have Chronic Hepatitis C, it can be cured!
- The Jefferson County Department of Health offers Hepatitis C testing and treatment to insured and uninsured individuals
